

Cloud Governance Process

Effective compliance & strong innovation for your cloud solutions

The cloud governance process encompasses the complete lifecycle of your cloud solutions, starting with onboarding, development, and operations and extending to offboarding. At all times, the process ensures the full technical and organizational compliance of your cloud initiatives, regardless of whether they work in a classic or agile way.

Two aspects of the process are essential: the sequential deployment of development, testing, and production cloud environments, and the integration of all key stakeholders for proper cloud operations. The process is designed in such a way that cloud initiatives only have to meet the compliance requirements that are actually relevant to the respective use case.

Our approach to effective cloud governance

High competitive pressure requires the rapid development of new products and solutions. However, compliance requirements can slow down development cycles enormously. Furthermore, business goals can conflict with the goals of information security. Skaylink's cloud governance process offers opportunities to mitigate or even resolve this contradiction. We design a process together with you that immediately enables your cloud initiatives to handle technical issues while at the same time meeting the compliance requirements corresponding to the respective level of maturity of the system.

The cloud governance process enables the development of innovative cloud systems that are still compliant with complex standards and frameworks.

Your benefits

- Rapid development of innovative cloud systems – even in highly regulated areas
- Clear processes and responsibilities throughout the entire life cycle of your cloud systems
- Integration of all stakeholders in your cloud governance
- Effective integration of industry-specific compliance regulations
- Governance requirements tailored to the needs of your cloud initiatives

Work with a cloud expert from the very beginning

Skaylink has more than 10 years of experience in cloud projects. We specialize in highly regulated sectors, such as banking and insurance, operators of critical infrastructure, and public sector customers.

Our expertise extends across all established cloud providers and cloud service offerings, including SaaS integration and governance.
